Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New metallo:proteinase inhibitor, analogues and DNA - for treating tumour cell dissemination, rheumatoid arthritis large-scale recombinant inhibitor produ.

Claim 12; Fig 2; 65pp; English.

Q73088 encodes R62769 human metalloproteinase inhibitor may be used to inhibit tumour cell dissemination and for rheumatoid arthritis, dystrophic epidermolysis bullosa, and osteoporosis. The DNA may be used to detect MI gene sequence 1033 BP; 215 A; 360 C; 305 G; 153
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human metalloproteinase inhibitor cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the amino acid sequence determined. A probe was synthesised based upon the proteal sequence information. It was used to screen a LambdaGem-4 cDNA library prepared from human melanoma cells. 239 positives were identified from a total of 750,000 plaques screened. Further analysis and screening with additional probes eliminated most of the clones. Clone pS388 was isolated and the nucleotide sequence of the cDNA insert was determined. The deduced amino acid sequence showed excellent agreement with that derived by directly sequencing the TIMP-2 protein.

PS Disclosure; Fig 6A; 54pp; English.

CC TIMP-2 was isolated from human melanoma cell-conditioned media and the amino acid sequence determined. A probe was synthesised based upon the protein sequence information. It was used to screen comparison of the protein sequence information. It was used to screen electrical actions and the protein sequence of 750,000 plaques screened. CC positives were identified from a total of 750,000 plaques screened. CC Further analysis and screening with additional probes eliminated to encode CSC-21K (=TIMP-2), a novel metalloproteinase inhibitor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New matrix metallo-proteinase inhibitor - used to treat diseases or resulting from matrix metallo-proteinase activity and in diagnosis, detection and purificm.

To diagnosis, detection and purificm.

So Disclosure; Fig 6B; 54pp; English.

CITMP-2 was isolated from human melanoma cell-conditioned media and control of the amino acid sequence determined. A probe was synthesised control of the protein sequence information. It was used to screen can based upon the protein sequence information. It was used to screen can be a sequence determined from human melanoma cells. 239 contitives were identified from a total of 750,000 plaques screened. CC Further analysis and screening with additional probes eliminated control of clones (pSSI5 and pSSI8). Both were sequenced and found concode CSC-2IK (-TIMP-2), a novel metalloproteinase inhibitor. CC see also USC317407 and w09010228.

The present sequence is that of the human small tissue inhibitor metalloprotease 2 (TIMP2) DNA. Expression of this sequence is negatively correlated with brain tumour malignancy, i.e. relative expression levels are: normal brain tissue > astrocytoma > anaplastic astrocytoma > glioblastoma. By determining the level of TIMP 2 expression in human brain tissue, the malignancy of cerebit tumours can be evaluated.

Sequence may be used to transform a procaryotic or eukaryotic expression system to give a product with all the biological properties of naturally occuring metalloproteinase inhibitor. The product has therapuetic use in inhibiting tumour dissemination during chemotherapy and radiation therapy, impurged bone marrow ce harvesting etc. The inhibitor may also be useful in encapsulating tumours aiding clean excision, and in treatment of enphysema, Page disease, osteoporosis, scleroderma and bedsores.
The gene product also has application in autoimmune disorders eg. The onessed of arthritis and multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                       mat_peptide

Claim 12; Fig 1; 65pp; English.

Q73087 encodes R62768 bovine metalloproteinase inhibitor (MI), it may be used to inhibit tumour cell dissemination and for treating rheumatoid arthritis, dystrophic epidermolysis bullosa, emphysema and osteoporosis. The DNA may be used to detect MI gene disorders. Sequence 1045 BP; 219 A; 350 C; 311 G; 165 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a CDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A full-length cDNA clone (T34433) codes for human tissue inhibitor of metalloproteinase-4 (TIMP-4) (R98265), which was identified as a novel member of the TIMP family. The cDNA clone was obtd. from a cDNA ilbrary derived from an early stage human brain. It can be used for prodn. of recombinant TIMP-4, using e.g. Escherichia coli, COS or insect cell hosts. It can also be used in gene therapy, or to design probes for use in diagnosis of a disease, or a susceptibility to a disease, related to a mutation in the human TIMP-4 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diseases,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence encodes a tissue inhibitor of metalloproteinases designated TIMP-4. This clone was identified with Incyte Clone No. 589345. TIMP-4 can be used to treat disorders associated with excessive metalloprotease expression, e.g. tumour metastasis, angiogenesis and growth, osteo-arthritis, osteoporosis, pulmonary emphysema, periodontal disease and rheumatoid arthritis, and for contraception. TIMP-4 cDNA can be used for gene therapy of such disorders and in diagnostic assays for TIMP-4 mRNA in cells and tissues. Oligonucleotide fragments of the TIMP-4 cDNA and antagonists or inhibitors of TIMP-4 can be used to treat disorders and antagonists or inhibitors of TIMP-4 can be used to treat disorders of corneal and diabetic ulcers and ulcers/lesions caused by microorganisms. Antibodies to TIMP-4 can be used to diagnose such ulcers or lesions. Sequence 675 BP; 154 A; 186 C; 181 G; 154 T;

The sequence was derived from the DNA encoding natriuretic peptide receptor B. NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodm. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mrainstruretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NRRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Q10572;

cDNA clone Timp3HCM-3 (T02351) codes for a natural variant (R84217) of tissue inhibitor metalloproteinase 3 (TIMP-3), lacking a portion of the N-terminus of the mature protein in comparison with the clone Timp3clone 7 product (R84215) Timp3HCM-3 was isolated from a human colonic mucosa cDNA library using primers based on TIMP sequences. The cDNA is pref. expressed in Escherich: coll for use in recombinant TIMP-3 product (R84215) Timp3HCM-3 was also be useful for gene therapy e.g. of emphysema.

CDNA clone Timp3clone2 (T02360) codes for a natural variant (R84216) of tissue inhibitor metalloproteinase 3 (TIMP-3), lacking part of the signal peptide of the Timp3clone 7 product (R84215). The cDNA clone was isolated from a human 20 and 24 wk foetal kidney cDNA library using primers based on TIMP sequences. The cDNA is pref. expressed in Escherichia coli for use in recombinant TIMP-3 prodn. Genes coding for TIMP may also be useful for gene therapy
